* 0.10 ** 0.05 *** 0.01. Standard Errors clustered at village level. Each Column is a spearate regression: odd columns regress binary attendance variable on continuous distance and school quality variables jointly, even columns regress binary attendance variable on discrete distance and school quality variables. Distance to closest primary school and school facility information from village head survey. School Facilities include if the school has pipe water, library, computers, robust buildings etc. All regressions include county fixed effects, province-specific age fixed effects, controls for village gdp per capita, land per capita and population count, as well as controls for the education of household head, household relative wealth, and the number of household members.
